

Tensile Marine Awnings

Innovation and design

We use 3D tensile membrane analysis to create awning structures that are optimised to be as stable as possible for the best performance under wind load.

We can combine on-site measurements with client supplied CAD drawings to create the framework for the awning models.

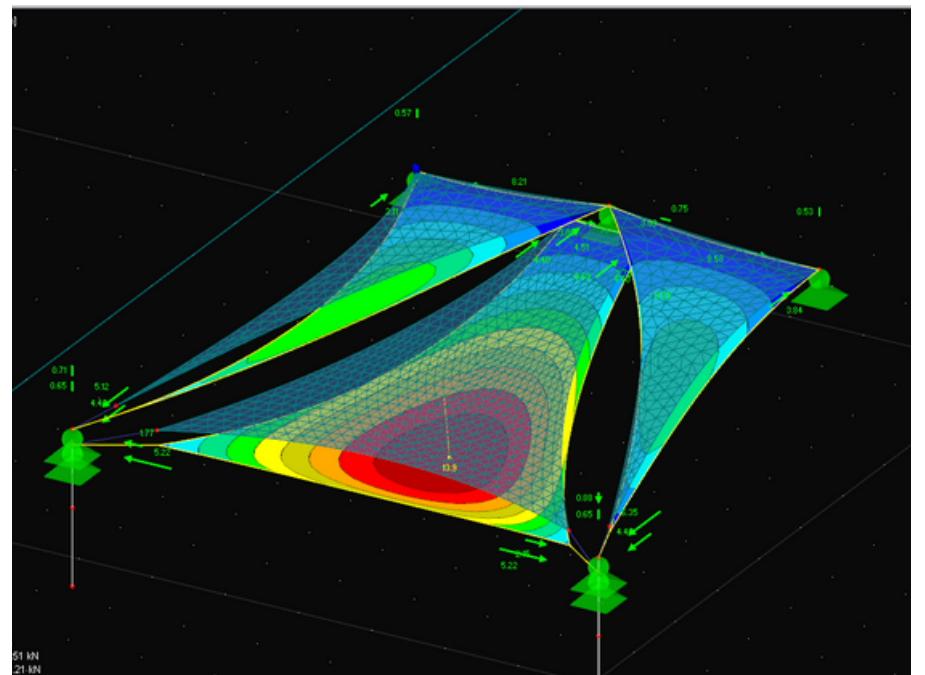

Materials and workmanship

We use only the highest quality materials to offer the best possible performance and longevity for our products.

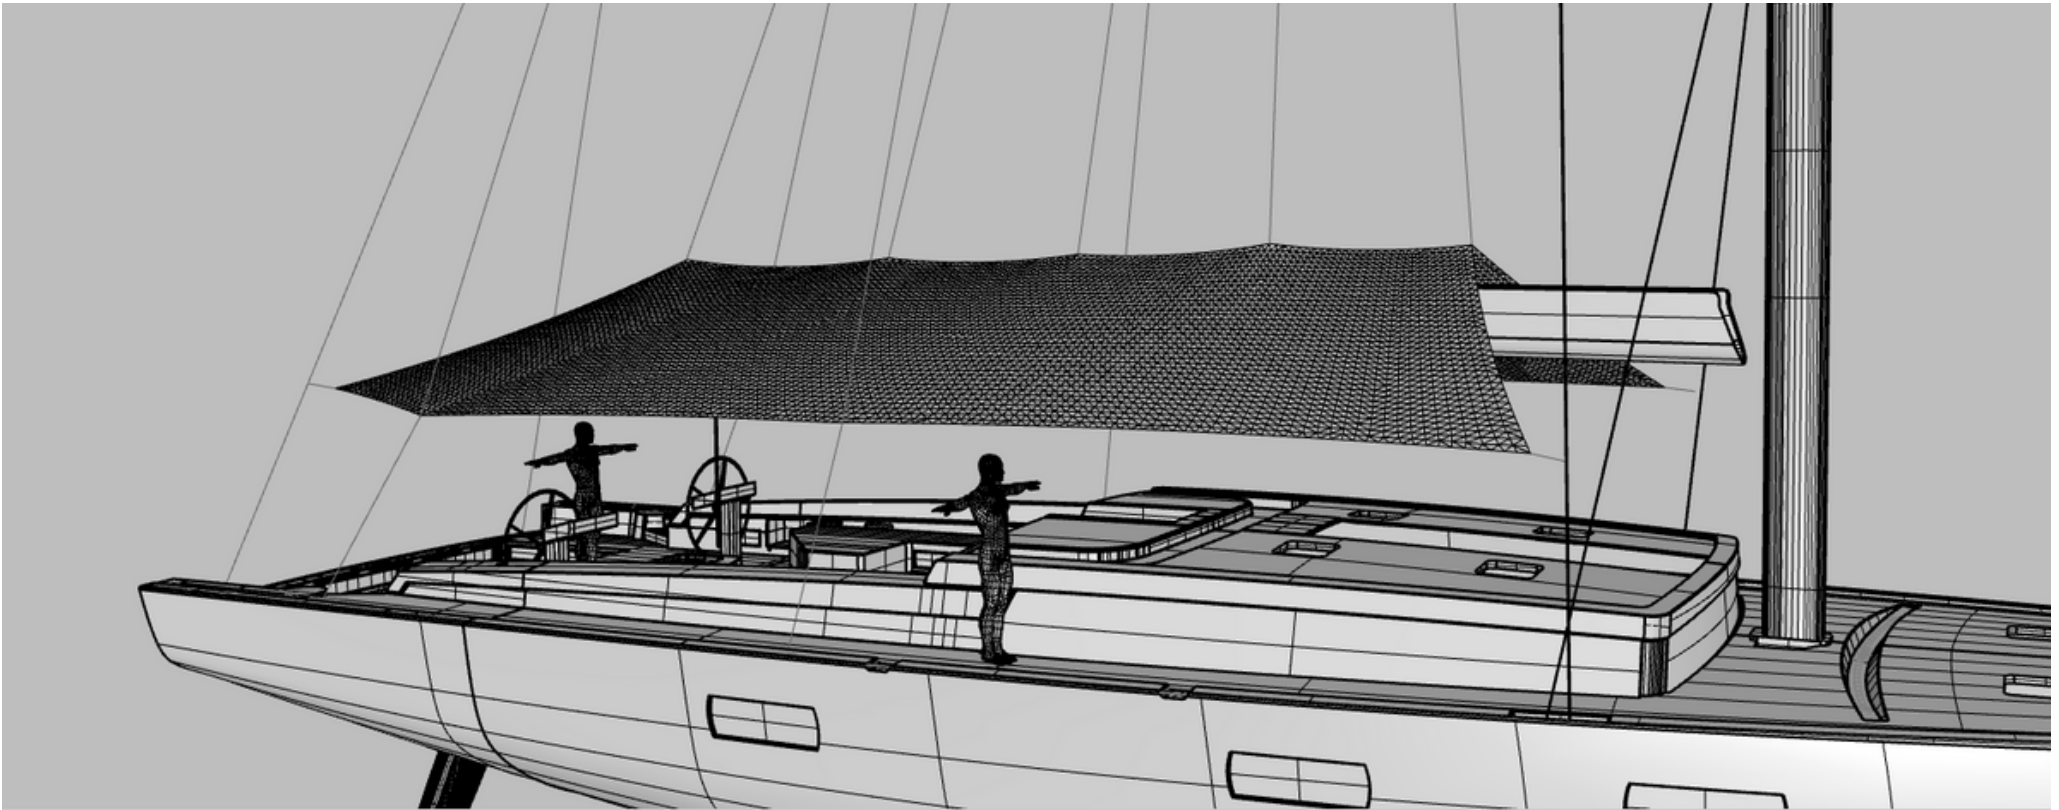

We prioritise ease of use and have developed refined and reliable attachment methods that are customised to each project.

We can offer a range of materials to suite all applications; from lightweight race awnings through to semi-permanent structures on larger motor yachts.

Ahead by design
